ABSTRACT OF THE DISCLOSURE

Disclosed is a device for adjusting a quantity of light, including a rotor adapted to be rotated with an axis portion as a center, a first bearing for supporting one end of the axis portion of the rotor, a second bearing for supporting the other end of the axis portion of the rotor, and a member for adjusting a quantity of light which moves in accordance with a rotation of the rotor. According to this construction, a portion of the first bearing into which the axis portion is fitted has a tapered shape, and the axis portion is brought into contact with the portion having the tapered shape of the first bearing, whereby the accuracy of determining a position at which the rotor stops is improved.
